

Qubes OS Cheatsheet

Qubes Cheatsheet

a summary of useful qubes commands

version: 3.2

Mini Glossary

- Xen - Hypervisor
- VM - Virtual Machine
- Qube - Qubes OS specific alias for VM
- Dom0 - Privileged Xen VM (runs Qubes Manager)
- DomU - Normal Xen VM
- QWT - Qubes Windows Tools
- PV - Paravirtualized VM
- HVM - Hardware Virtual Machine
- HVM + PV drivers - HVM with PV drivers (Windows + QWT)
- GUI - Graphical User Interface

VM Management

NOTE: All commands are executed in @Dom0 terminal (Konsole, Terminal, Xterm etc.)

qubes-manager - Graphical VM Manager

usage: qubes-manager

qvm-block - Lists/attaches VM PCI devices

usage:

- qvm-block -l [options]
- qvm-block -a [options] <device> <vm-name>
- qvm-block -d [options] <device>
- qvm-block -d [options] <vm-name>

qvm-block -A personal dom0:/home/user/extradisks/data.img - attaches an additional storage for the personal-vm

qvm-clone - Clones an existing VM by copying all its disk files

usage: qvm-clone [options] <existing-vm-name> <new-clone-vm-name>

qvm-clone fedora-23 fedora-23-dev - create a clone of fedora-23 called fedora-23-dev

qvm-firewall - Manage VM firewall rules

usage: qvm-firewall -l [-n] <vm-name>

qvm-firewall -l personal - displays the firewall settings for the personal-vm

qvm-firewall -l -n fedora-23 - displays the firewall settings for the personal-vm with port numbers

qvm-ls - *Lists VMs and various information about their state*

usage: qvm-ls [options] <vm-name>

qvm-ls - *lists all vms*

qvm-ls -n - *show network addresses assigned to VMs*

qvm-ls -d - *show VM disk utilization statistics*

qvm-prefs - *List/set various per-VM properties*

usage:

- qvm-prefs -l [options] <vm-name>
- qvm-prefs -s [options] <vm-name> <property> [...]

qvm-prefs win7-copy - *lists the preferences of the win7-copy*

qvm-prefs win7-copy -s mac 00:16:3E:5E:6C:05 - *sets a new mac for the network card*

qvm-prefs lab-win7 -s qrexec_installed true - *sets the qrexec to installed*

qvm-prefs lab-win7 -s qrexec_timeout 120 - *usefull for windows hvm based vms*

qvm-prefs lab-win7 -s default_user joanna - *sets the login user to joanna*

qvm-run - *Runs a specific command on a vm*

usage: qvm-run [options] [<vm-name>] [<cmd>]

qvm-run personal xterm - *runs xterm on personal*

qvm-run personal xterm --pass-io - *runs xterm and passes all stdin/stdout/stderr to the terminal*

qvm-run personal "sudo dnf update" --pass-io --nogui - *pass a **dnf update** command directly to the VM*

qvm-start - *Starts a vm*

usage: qvm-start [options] <vm-name>

qvm-start personal - *starts the personal-vm*

qvm-start ubuntu --cdrom personal:/home/user/Downloads/ubuntu-14.04.iso - *starts the ubuntu-vm with the ubuntu installation CD*

qvm-shutdown - *Stops a vm*

usage: qvm-shutdown [options] <vm-name>

qvm-shutdown personal - *shutdowns the personal-vm*

qvm-shutdown --all - *shutdowns all VM's*

qvm-kill - *Kills a VM - same as pulling out the power cord - immediate shutdown*

usage: qvm-kill [options] <vm-name>

qvm-kill personal - *pull the power cord for the personal-vm - immediate shutdown*

qvm-trim-template - *Trims the disk space of a template*

usage: qvm-trim-template <template-name>

qvm-trim-template debian-8 - *helpful after upgrading or removing many packages/files in the template*

qvm-sync-appmenus - *Updates desktop file templates for given StandaloneVM or TemplateVM*

usage: qvm-sync-appmenus [options] <vm-name>

qvm-sync-appmenus archlinux-template - *useful for custom .desktop files or distributions not using dnf*

Dom0

qubes-dom0-update - *Updates or installes software in dom0*

usage: qubes-dom0-update [--enablerepo] [--disablerepo] [--clean] [--check-only] [--gui] [--action=*<pkg list>]

or

usage: qubes-dom0-update

qubes-dom0-update --check-only - *checks if new dom0 updates are available*

sudo qubes-dom0-update - *updates dom0*

sudo qubes-dom0-update --gui - *allows to update dom0 through a graphical window*

sudo qubes-dom0-update --enablerepo=qubes-dom0-current-testing qubes-windows-tools - *install the windows tools (QWT)*

sudo qubes-dom0-update --action=search <search-term> - *searches for package in dom0 repositories*

example:

sudo qubes-dom0-update --action=search qubes - *searches for all **qubes** package in dom0 repositories*

NOTE: The tool excludes all templates (community and ITL) by default

sudo qubes-dom0-update --action=info <package-name> - *displays infos about the package*

example:

sudo qubes-dom0-update --action=info qubes-core-dom0 - *displays infos about the **qubes-core-dom0** package*

qubes-hcl-report - *Generates a report about the system hardware information*

usage: qubes-hcl-report [-s] [<vm-name>]

qubes-hcl-report - *prints the hardware information on the console (terminal)*

qubes-hcl-report personal - *sends the hardware information to the personal-vm under /home/user*

qubes-hcl-report -s - *prints the hardware information on the console (terminal) and generates more detailed report*

qubes-hcl-report -s personal - *sends the detailed hardware information report to the personal-vm*

Note: qubes-hcl-report -s [<vm-name>] generates a more detailed report. This report can contain sensitive information. Please do not upload the report if you do not want to share those information.

virsh - *Management user tool for libvirt (hypervisor abstraction)*

usage: virsh -c xen:/// <command> [<vm-name>]

virsh -c xen:/// list - *list running VM's with additional information*

virsh -c xen:/// list --all - *list all VM's with additional information*

virsh -c xen:/// dominfo personal - *lists status of personal VM*

xl - *Xen management tool, based on LibXenlight*

usage: xl <subcommand> [<args>]

xl top - *Monitor host and domains in realtime*

DomU

qvm-copy-to-vm - *Copy file from one VM to another VM*

usage: qvm-copy-to-vm <vm-name> <file> [<file+>] - *file* can be a single file or a folder

qvm-copy-to-vm work Documents - *copy the Documents folder to the work VM*

qvm-copy-to-vm personal text.txt - *copy the text.txt file to the personal VM*

Example

- Open a terminal in AppVM A (e. g. your personal vm)
- Let's assume we want to copy the Documents folder to AppVM B (e. g. your work VM)
- The command would be: qvm-copy-to-vm work Documents

qvm-open-in-vm - *Opens file in another VM*

usage: qvm-open-in-vm <vm-name> <file> - *file* can only be a single file

qvm-open-in-vm personal document.pdf - *opens document.pdf in the personal VM*

qvm-copy-to-vm personal download.zip - *opens download.zip in the personal VM*

DomU and Dom0

List Qubes commands

1. Enter in console:
2. qvm-*
3. qubes*
4. Press 2x times TAB

Output: List of qvm-* or qubes* commands.

List installed Qubes OS packages - *List all installed Qubes OS packages*

Fedora Dom0

In VM or Dom0: rpm -qa *qubes-* - *list (qubes-) installed packages*

Files/Folders from and to Dom0

Move Dom0 -> VM

Qubes 3.1+ - *Windows + Linux*

dom0 console: qvm-move-to-vm <vm-name> <file> [<file+>] - *file* can be a single file or a folder

qvm-move-to-vm work screenshot-qubes-gui.png - *moves screenshot-qubes-gui.png to the personal VM into the /home/user/QubesIncoming/dom0 folder*

qvm-move-to-vm personal *.png - *moves all .png to the personal VM into the /home/user/QubesIncoming/dom0 folder*

qvm-move-to-vm work Pictures/ - *moves the Pictures folder and it's content to the personal VM into the /home/user/QubesIncoming folder*

Copy Dom0 -> VM

Qubes 3.1+ - *Windows + Linux*

dom0 console: qvm-copy-to-vm <vm-name> <file> [<file+>] - *file* can be a single file or a folder

qvm-copy-to-vm personal screenshot-qubes-gui.png - *copies screenshot-qubes-gui.png to the personal VM in the /home/user/QubesIncoming/dom0 folder*

qvm-copy-to-vm personal *.png - *copies all .png to the personal VM in the /home/user/QubesIncoming/dom0 folder*

qvm-copy-to-vm work Pictures/ - *copies the Pictures folder and it's content to the personal VM in the /home/user/QubesIncoming folder*

Qubes < 3.1 - Linux only

```
cat /path/to/file_in_dom0 |
qvm-run --pass-io <dst_domain>
'cat > /path/to/file_name_in_appvm'
```

```
@dom0 Pictures]$ cat my-screenshot.png |
qvm-run --pass-io personal
'cat > /home/user/my-screenshot.png'
```

VM -> Dom0

```
qvm-run --pass-io <src_domain>
'cat /path/to/file_in_src_domain' >
/path/to/file_name_in_dom0
```

Copy text between VM A and B

On VM A (source):

1. CTRL+C
2. CTRL+SHIFT+C

On VM B (destination):

3. CTRL+SHIFT+V
4. CTRL+V

Troubleshoot

Application in VM does not start - How to get more information if applications in a VM refuse to start

`qvm-run personal "command" --pass-io` - pass command directly to the VM. Returns an error message command fails.

`qvm-run personal "xterm" --pass-io` - pass *xterm* command directly to the VM. Returns an error message or starts *xterm*.

`qvm-run <vmname> "command" --pass-io --nogui` - pass command to VM without using the GUI

`qvm-run personal "ls" --pass-io --nogui` - pass *ls* command directly to the VM. Returns error or output.

Console in VM - Attach a console to a VM

```
virsh -c xen:/// console <vmname> - opens console in <vmname>
```

Why? Connect if GUI/qrexec does not work for any reason. This way you can restart/investigate a failed service.

- In Dom0 terminal: `virsh -c xen:/// console personal`
- username: **root** without a password

(and when #1130 would be implmented the same for “user”)

In console mode press CTRL + ^ +] on keyboard to escape from console mode.

AppVM Log files - Log files in AppVMs

`/var/log/qubes` - log file directory

log files per DomU VM:

- `guid.<vmname>.log` - graphical information
- `pacat.<vmname>.log` - sound information
- `qrexec.<vmname>.log` - inter VM communication information
- `qubesdb.<vmname>.log` - qubesdb information

Get Qubes OS Version - *Get the Qubes OS release version*

`cat /etc/qubes-release` - *prints Qubes release in human readable form*

`rpm -qa *qubes-release*` - *prints exact Qubes release number*

Get Xen Version - *Display the Xen version*

`xl info | grep xen_version` - *prints the Xen version*

Qubes OS / Xen Boot - *Qubes OS and Xen system/kernel messages*

`dmesg` - *prints error, warning and informational messages about device drivers and the kernel during the boot process as well as when we connect a hardware to the system on the fly.*

`xl dmesg` - *prints error, warning and informational messages created during Xen's boot process*

TIP: use `dmesg` and `xl dmesg` in combination with `less`, `cat`, `tail` or `head`.

Grow disk

qvm-grow-private - *Increase private storage capacity of a specified VM*

usage: `qvm-grow-private <vm-name> <size>`

Example

- In dom0 terminal: `qvm-grow-private personal 40GB`
- In the personal VM: `sudo resize2fs /dev/xvdb`

Enlarge AppVMs TMPFS

Enlarge `/tmp` if you run out of space on the default ~200MB

`sudo mount -o remount,size=1024M /tmp` - *enlarge the space to 1024MB*

Inter VM Networking

NOTE: Does not expose services to the outside world!

Make sure:

- Both VMs are connected to the same firewall VM
- Qubes IP addresses are assigned to both VMs
- Both VMs are started

In Firewall VM terminal:

`$ sudo iptables -I FORWARD 2 -s <IP address of A> -d <IP address of B> -j ACCEPT`

- The connection will be unidirectional A -> B
- Optional: Bidirectional A <-> B

In Firewall VM terminal:

`$ sudo iptables -I FORWARD 2 -s <IP address of B> -d <IP address of A> -j ACCEPT`

- Check your settings (e. g. using ping)
- Persist your settings:

Assume:

IP of A: 10.137.2.10

IP of B: 10.137.2.11

In Firewall VM terminal:

`$ sudo bash`

`# echo "iptables -I FORWARD 2 -s 10.137.2.10 -d 10.137.2.11 -j ACCEPT" >> /rw/config/qubes_firewall_user_script`

`# chmod +x /rw/config/qubes_firewall_user_script`

for bidirectional access:

`# echo "iptables -I FORWARD 2 -s 10.137.2.10 -d 10.137.2.11 -j ACCEPT" >> /rw/config/qubes_firewall_user_script`

Add USB Wifi card to sys-net VM - *Attach a USB Wifi card to sys-net VM*

The bus and device number can be different than shown in this example:

1. `qvm-pci -l sys-net` - *list all attached pci devices of sys-net*
2. `lsusb` - e. g. **Bus 003 Device 003: ID 148f:2870 Ralink Technology, Corp. RT2870 Wireless Adapter**
3. `readlink /sys/bus/usb/devices/003` - *Important Bus 003 -> 003*
4. The result of `readlink`: `../../../../devices/pci-0/pci0000:00/0000:00:12.2/usb3` - *Important 00:12.2*
5. `qvm-pci -a sys-net 00:12.2` - *attach USB device 00:12.2 to sys-net*
6. `qvm-pci -l sys-ne` - *check if device 00:12.2 is*

Templates

Fedora - *Fedora template specific*

Installing the Template

`sudo qubes-dom0-update qubes-template-fedora-24` - *installs the fedora-24 template*

`sudo qubes-dom0-update qubes-template-fedora-23` - *installs the fedora-23 template*

Updating, Searching & Installing Packages

Fedora > 21

- installing packages: `dnf install <package-name>`
- search for a package: `dnf search <package-or-word>`
- updating template: `dnf update`

Fedora <= 21

- installing packages: `yum install <package-name>`
- search for a package: `yum search <package-or-word>`
- updating template: `yum update`

Repositories

NOTE: Does not work anymore under fedora 23

Repositories: Start Menu >> Template:Fedora 21 >> Package Sources >> Enable third party repositories

Start Menu >> Template:Fedora 21 >> Package Sources >> Enable RPMFusion - ENABLE RPMFusion, (already covers RPMFusion signing keys)

Fedora Minimal - *Fedora minimal template*

Qubes OS:

`sudo qubes-dom0-update qubes-template-fedora-24-minimal` - *installs the fedora-24-minimal template*

`sudo qubes-dom0-update qubes-template-fedora-23-minimal` - *installs the fedora-23-minimal template*

`sudo qubes-dom0-update qubes-template-fedora-21-minimal` - *installs the fedora-21-minimal template*

Debian - *Debian template*

Installing the Template

- `sudo qubes-dom0-update qubes-template-debian-8` - *Debian 8 “Jessie”*

Only till Qubes OS 3.1:

- `sudo qubes-dom0-update qubes-template-debian-7` - *Debian 7 “Wheezy”*

Updating, Searching & Installing Packages

- installing packages: `apt-get install <package-name>`
- search for a package: `apt-cache search <package-or-word>`
- updating template:
 1. `apt-get update`
 2. `apt-get dist-upgrade`

Qubes OS + Whonix - *Whonix is an Debian based OS focused on anonymity, privacy and security*

Whonix consists of two components:

1. Whonix-Gateway (uses TOR for all connections to the outside world)
2. Whonix-Workstation (for application)

Install Whonix

Whonix-Gateway TemplateVM Binary Install @Dom0:

```
sudo qubes-dom0-update --enablerepo=qubes-templates-community qubes-template-whonix-gw-experimental
```

Whonix-Workstation TemplateVM Binary Install @Dom0:

1. `export UPDATES_MAX_BYTES=$((4 * 1024 ** 3))`
2. `sudo qubes-dom0-update --enablerepo=qubes-templates-community qubes-template-whonix-ws`

Next Steps

1. Create a Whonix-gateway ProxyVM, through Qubes VM Manager
2. Create a Whonix-workstation AppVM, through Qubes VM Manager
3. Update your Whonix-Gateway and Whonix-Workstation TemplateVMs (how to -> see debian)
4. (Re)Start Whonix-Gateway ProxyVM
5. Start Whonix-Workstation AppVM

Archlinux - *Archlinux template*

Installing the Template

In Qubes OS 3.2:

```
sudo qubes-dom0-update --enablerepo=qubes-templates-community qubes-template-archlinux
```

or manually

Use the following instructions: [Archlinux Template](#)

Updating, Searching & Installing Packages

- installing packages: `pacman -S <package-name> [<package-name-2>...<package-name-n>]`
- search for a package: `pacman -Ss <package-or-word>`
- updating template: `pacman -Syyu`

Create VM from VMware or VirtualBox images

1. Download the image in an AppVM
2. Install `qemu-img` tools - *e. g. `dnf install qemu-img` for fedora*
3. Convert the image to a raw format:
 - VMware: `qemu-img convert ReactOS.vmdk -O raw reactos.img`
 - VirtualBox: `qemu-img convert ReactOS.vdi -O raw reactos.img`

Qubes OS Directories

Dom0 (Qubes OS) - *Qubes OS specific directories*

- `/var/log/qubes` - *Qubes OS VM log files*
- `/var/lib/qubes` - *Qubes OS VMs and other Qubes OS specific files*

Qubes OS Repositories

- <http://yum.qubes-os.org> - *Browsable Fedora repositories*
