## **Qubes OS Cheatsheet**

# VM Management qvm-block - list/set VM PCI devices usage: • qvm-block -l [options] • qvm-block -a [options] <device> <vm-name> • qvm-block -d [options] <device> • qvm-block -d [options] <vm-name> qvm-block -A personal dom0:/home/user/extradisks/data.img - attaches an additional storage for the personal-vm qvm-ls - list VMs and various information about their state usage: qvm-ls [options] <vm-name> qvm-ls - lists all vms qvm-ls -n - show network addresses assigned to VMs qvm-ls -d - show VM disk utilization statistics qvm-prefs - list/set various per-VM properties usage: • qvm-prefs -1 [options] <vm-name> • qvm-prefs -s [options] <vm-name> <property> [...] qvm-prefs win7-copy - lists the preferences of the win7-copy qvm-prefs win7-copy -s mac 00:16:3E:5E:6C:05 - sets a new mac for the network card qvm-prefs lab-win7 -s qrexec\_installed true - sets the qrexec to installed qvm-prefs lab-win7 -s qrexec\_timeout 120 - usefull for windows hvm based vms qvm-prefs lab-win7 -s default\_user joanna - sets the login user qvm-run - runs a specific command on a vm usage: qvm-run [options] [<vm-name>] [<cmd>] qvm-run personal xterm - runs xterm on personal qvm-run personal xterm --pass-io - runs xterm and passes all sdtin/stdout/stderr to the terminal qvm-run personal "sudo yum update" --pass-io --nogui - pass a specific command directly to the VM

```
qvm-start - starts a vm
usage: qvm-start [options] <vm-name>
qvm-start personal - starts the personal-vm
qvm-start ubuntu --cdrom personal:/home/user/Downloads/ubuntu-14.04.iso - starts the ubuntu-vm with the ubuntu instal-
lation CD
qvm-sync-appmenus - updates desktop file templates for given StandaloneVM or TemplateVM
usage: qvm-sync-appmenus [options] <vm-name>
qvm-sync-appmenus archlinux-template - useful for custom .desktop files or distributions not using yum
Dom<sub>0</sub>
qubes-dom0-update - updates software in dom0
usage: qubes-dom0-update [--clean][--check-only][--gui] [<yum opts>][<pkg list>]
sudo qubes-dom0-update - updates\ dom \theta
sudo qubes-dom0-update qubes-windows-tools - install the windows tools
qubes-hcl-report - generates a report about the hardware information
usage: qubes-hcl-report [<vm-name>]
qubes-hcl-report - prints the hardware information on the console (terminal)
qubes-hcl-report personal - sends the hardware information to the personal-vm under /home/user
```

xl - Xen management tool, based on LibXenlight

xl top - Monitor host and domains in realtime

qvm-copy-to-vm - Copy file from one VM to another VM

• Open a terminal in AppVM A (e. g. your personal vm)

• The command would be: qvm-copy-to-vm work Documents

In VM or Dom0: rpm -qa \\*qubes-\\* - list (qubes-) installed packages

xl dmesg - Dom0 dmesg output (first place to look for warning or error messages)

qvm-copy-to-vm work Documents - copy the Documents folder to the work VM qvm-copy-to-vm personal text.txt - copy the text.txt file to the personal VM

usage: qvm-copy-to-vm <vm-name> <file> [<file+>] - file can be a single file or a folder

• Let's assume we want to copy the Documents folder to AppVM B (e. g. your work VM)

usage: xl subcommand [args]

DomU

Example

**Fedora** 

DomU and Dom0

List installed qubes packages

```
Copy from & to Dom0
Copy from: Dom0 -> VM
cat /path/to/file_in_dom0 |
 qvm-run --pass-io <dst_domain>
  'cat > /path/to/file_name_in_appvm'
Copy from: VM \rightarrow Dom0
qvm-run --pass-io <src domain>
 'cat /path/to/file_in_src_domain' >
  /path/to/file_name_in_dom0
Copy text between VM A and B
On VM A (source):
  1. CTRL+C
  2. CTRL+SHIFT+C
On VM B (destination):
  3. CTRL+SHIFT+V
  4. CTRL+V
```

#### Grow disk

qvm-grow-private - increase private storage capacity of a specified VM

usage: qvm-grow-private <vm-name> <size>

#### Example

- In dom0 konsole: qvm-grow-private personal 40GB
- In the personal VM: sudo resize2fs /dev/xvdb

#### VM -> VM Networking

Make sure:

- Both VMs are connected to the same firewall VM
- Qubes IP addresses are assigned to both VMs
- Both VMs are started

Firewall VM's terminal:

sudo iptables -I FORWARD 2 -s <IP address of A> -d <IP address of B> -j ACCEPT

#### **Templates**

Fedora Minimal - Fedora minimal template

 $\verb|sudo| qubes-dom0-update| qubes-template-fedora-21-minimal| - installs| the fedora-21-minimal| template| - installs| - inst$ 

#### **Archlinux Minimal** - Archlinux minimal template

1. In a VM:

```
wget http://olivier.medoc.free.fr/rpm/noarch/
{\tt qubes-template-archlinux-minimal-3.0.3-201507281153.noarch.rpm}
```

- 2. Copy RPM-Package to Dom0
- 3. In Dom0: sudo rpm -i qubes-template-archlinux-minimal-3.0.3-201507281153.noarch.rpm

### Create VM from VMware or VirtualBox images

- 1. Download the image in an  ${\rm AppVM}$
- 2. Install qemu-img tools  $e.\ g.\ yum\ install\ qemu-img\ for\ fedora$
- 3. Convert the image to a raw format:
- $\bullet~\mathrm{VMware}\colon \mathtt{qemu\text{-}img}$  convert ReactOS.vmdk -O raw reactos.img
- VirtualBox: qemu-img convert ReactOS.vdi -O raw reactos.img
